

Orchid Pollinators of Victoria.

There is so much to learn about the world of orchids and the role the insects play in the pollination of such highly evolved plants. Orchids and insects are constantly under attack by the human race - *ruining their environment* - clearing & burning habitats, and the overuse of *insecticides*. Without the wasps, bees and flies we would not exist and they should be valued like all other wild creatures for the protection of habitats, and realise the importance of their diversity. To observe the pollinators in action it is essential to have a good understanding of nature, be familiar with the insects, and be very patient. The intriguing role insects play in orchid pollination is documented in this book and I hope that together with more than 1300 superb images it will give the insects the appreciation they deserve, even if they may bite or sting.
